## DoD FACILITIES COST FACTOR HANDBOOK

### Introduction

To promote macro-level analysis and planning, DoD implemented a facility classification system that groups facilities with similar functions and units of measure into Facility Analysis Categories (FACs). For each of nearly four hundred FACs, this handbook identifies both sustainment and construction cost factors and the source upon which they are based. Whenever possible, cost factors have been based upon commercial benchmarks. As with the FACs they represent, these cost factors are intended for macro-level analysis and planning and are not suitable for individual facilities or projects.

### New In This Version

Version 3.0 of the handbook expands on the research presented in Version 2.0 (April 2000) and modifies the presentation format. Changes included are:

- Four new FACs: 3102, 3903, 3904, and 8122.
- Updated cost factors for FACs measured in square feet based upon a commercial cost-estimating model (the MARS 3.0 Facility Maintenance Cost Forecast System developed by Whitestone Research Corporation). The MARS system provides increased accuracy and consistency by generating costs from detailed component lists that include roof structures, walls, doors, windows, HVAC components, plumbing fixtures, electrical components, and other specialized items tailored to each FAC.
- Updated cost factors for specific facility types (runway pavements and medical facilities) based upon more-detailed cost data from users.
- A consolidated cost factor table that includes all pertinent cost factor information.
- Expanded FAC descriptions that include “average” size information upon which the cost factors are based.
- New category code-to-FAC reference tables.
- New guidelines for revising cost factors.

### Sustainment Cost Factors

#### Definition of Facilities Sustainment

Provides resources for maintenance and repair activities necessary to keep a typical inventory of facilities in good working order over a 50-year service life. It includes regularly scheduled adjustments and inspections, preventive maintenance tasks, and emergency response and service calls for minor repairs. It also includes major repairs or

replacement of facility components (usually accomplished by contract) that are expected to occur periodically throughout the facility life cycle. This work includes regular roof replacement, refinishing wall surfaces, repairing and replacing electrical, heating, and cooling systems, replacing tile and carpeting, and similar types of work.<sup>1</sup> It does not include repairing or replacing non-attached equipment or furniture, or building components that typically last more than 50 years (such as foundations and structural members). Sustainment does not include restoration, modernization, environmental compliance, specialized historical preservation,<sup>2</sup> or costs related to acts of God, which are funded elsewhere. Other tasks associated with facilities operations (such as custodial services, grass cutting, landscaping, waste disposal, and the provision of central utilities) are also not included.<sup>3</sup>

## Use of Sustainment Cost Factors

Sustainment requirements can be forecasted accurately using unit cost factors adjusted for location. DoD employs such a cost-factor methodology in the Facilities Sustainment Model (FSM) to determine the DoD-wide facility sustainment requirement. The formula is:

$$\text{Requirement} = \text{Facility Quantity}^4 \times \text{Sustainment Cost Factor} \times \text{Area Cost Factor}^5 \times \text{Inflation Factor}$$

The cost factor methodology is inherently superior to other methods in calculating sustainment requirements. Another common method—using a percentage of plant replacement value—is a less-accurate generalization across an entire inventory. In terms of plant replacement value, actual sustainment costs for DoD facilities range from considerably less than 1% (emergency power generators) to over 8% (unsurfaced roads or energy management control systems). This finding is supported by Whitestone Research.<sup>6</sup> The backlog of maintenance and repair (BMAR) is also fraught with problems, including subjectivity, the difficulty and expense of obtaining a valid number, and its propensity to change independent of funding levels. Even if these inherent problems could be overcome, BMAR fails as a facilities sustainment metric since the backlog often includes other costs (such as restoration and modernization) that are beyond the scope of sustainment. Because of this, DoD no longer uses BMAR as a metric.

<sup>1</sup> Facilities Sustainment also generally allows for overhead costs, which include architectural and engineering services.

<sup>2</sup> Specialized historical preservation costs are those for customized components or materials that are no longer readily available.

<sup>3</sup> Facilities Sustainment Program Element (PE) definition adopted for use in FY 2003 budget development.

<sup>4</sup> The application of cost factors to existing real property records could lead to large errors if the inventory and units of measure are not first screened and validated, as is done in the DoD Facilities Sustainment Model. These errors and conversions primarily involve facility categories that are measured in terms of capacity (miles, feet, kilovolts, kilowatts, gallons, thousands of gallons per day, millions of BTU per hour, etc.).

### Selection of Sustainment Cost Factors

In selecting from possible sustainment cost sources, the most credible factor was assigned to each facility category. General “credibility” was determined by a priority scheme for groups of cost factor sources. Where two or more cost factors were available within the top group, a selection was based upon engineering judgment and approved by consensus of the DoD FSM working group.

Sustainment Cost Factor Source Hierarchy	
Source 1	Standard, off-the-shelf, commercially published sources (e.g., Whitestone). These sources are considered most desirable due to ease of access, wide applicability, and lack of bias. Publications cover whole facilities and separate components of facilities, and include factors from professional associations and certain non-DoD federal, state, or local government agencies.
Source 2	Source 1 cost factors that are applied to facilities with similar but not identical characteristics (e.g., sewage waste treatment facilities and industrial waste treatment facilities). Source 2 includes Service-validated cost factors for facilities that have no commercial counterparts (e.g. missile launch facilities or military ranges).
Source 3	Cost factors derived from Source-1 factors by multiplying the construction cost factor by the ratio of the sustainment cost factor to the construction cost factor for a similar Source-1 Facilities Analysis Category (e.g. FAC 2115, Aircraft Maintenance Hangar, Depot derived from FAC 2111, Aircraft Maintenance Hangar).

### Distribution of Sustainment Cost Factors

For each cost factor, the cost factor table in this handbook indicates the source group (1, 2, or 3) that is intended to reflect its relative accuracy and credibility. In version 3.0 of the handbook, 76% of the facility categories (representing 94% of DoD’s plant replacement value—up from 90% in version 2.0) are assigned Source 1 sustainment cost factors.

## Construction Cost Factors

### Definition of Construction

Construction provides a complete and useable facility capable of serving the purposes for which it was designed. Construction costs include pilings, foundations, all interior and exterior walls and doors, the roof, utilities up to the 5-foot line, all built-in plumbing and lighting fixtures, security and fire protection systems, electrical distribution, wall and floor coverings, heating and air conditioning systems, and elevators. Not included are items generally termed personal property such as computer systems, telephone instruments, and furniture. Also not included are project costs such as design, supporting facility costs, equipment acquired with other funding sources (e.g. mission-funded range targets), contingency costs, and supervision, inspection, and overhead (SIOH).

### Use of Construction Cost Factors

Construction cost factors form the basis of calculating plant replacement value. The standard DoD algorithm for calculating plant replacement value is:

$$\text{Plant Replacement Value} = (\text{Facility Quantity}^7 \times \text{Construction Cost Factor} \times \text{Area Cost Factor}^8) \times 1.2^9$$

While this methodology is generally accepted, there has been significant divergence on the cost factors used in these calculations. Adoption of the standardized cost factors presented here will greatly increase the accuracy and consistency of plant replacement value calculations across DoD.

Construction cost factors can also support new construction cost estimates. As with sustainment cost calculations, such estimates are most reliable at the programmatic level, and lose accuracy when applied to specific facilities or projects. These calculations can be useful for DoD and Service-level modeling of:

- Re-stationing and Regionalization
- Joint facilities studies
- Determining rates of re-capitalization
- Describing the magnitude of a facility inventory in a common unit of measure

---

<sup>7</sup> The application of cost factors to existing real property records could lead to large errors if the inventory and units of measure are not first screened and validated, as is done in the DoD Facilities Sustainment Model. These errors and conversions primarily involve facility categories that are measured in terms of capacity (miles, feet, kilovolts, kilowatts, gallons, thousands of gallons per day, millions of BTU per hour, etc.)

<sup>8</sup> A geographic location adjustment for costs of labor, material, and equipment, published by the Tri-Service Committee on Cost Engineering.

<sup>9</sup> The 1.2 multiplier accounts for supervision, inspection, overhead, and design.

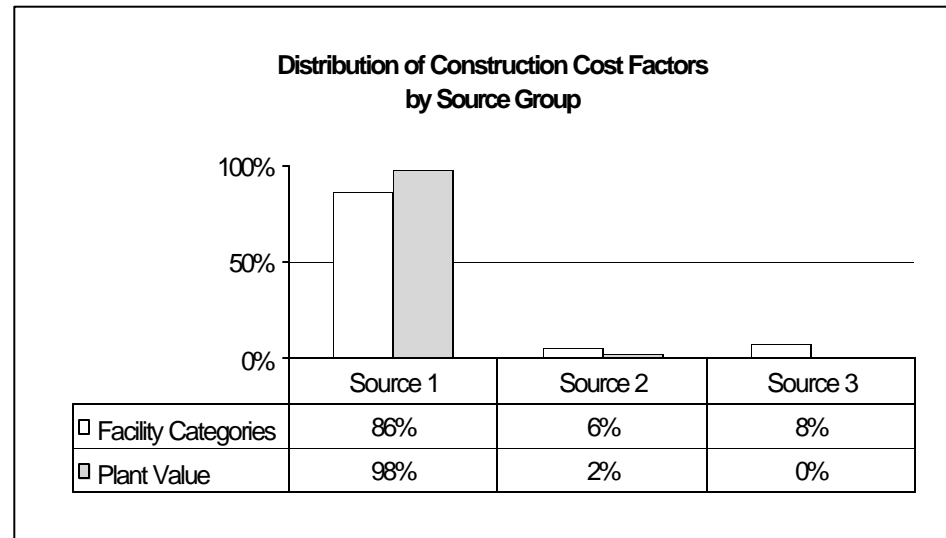

### Selection of Construction Cost Factors

As with sustainment cost factors, a hierarchy was established for groups of cost factor sources. Where more than one cost factor source was available within Source 1, a selection was based upon engineering judgment and approved by consensus of the FSM Working Group.

Construction Cost Factor Source Hierarchy	
Source 1	Easily-accessed and widely applicable data. Cost factors in this category were taken directly from the DoD Tri-Service Committee on Cost Engineering (mandatory within the DoD for applicable construction); Service-specific cost guidance (USACE, USAF); commercial cost-estimating guidelines (e.g., M&S or Whitestone); or other Government-published cost guidance (e.g. Fairfax County (Virginia) Park Authority).
Source 2	Unpublished government or trade association average cost data (e.g. CEAC).
Source 3	Unpublished project-specific data, derived from Service project documents (e.g. DD Forms 1391), or by calculating costs from reported plant replacement value and inventory.

### Distribution of Construction Cost Factors

For each construction cost factor, the cost factor table indicates the source group (1, 2, or 3) that is intended to reflect its relative accuracy and credibility. In version 3.0 of the handbook, 86% of the facility categories (representing 98% of DoD's plant replacement value—up from 93% in version 2.0) are assigned Source 1 cost factors.

## Guidelines for Revising Published Cost Factors

Users of the DOD FACILITIES COST FACTOR HANDBOOK are encouraged to suggest revisions to the published cost factors, particularly for facilities unique to their mission. Submissions should be made to the Office of the Under Secretary of Defense for Installations (ODUSD(I)/A&I)<sup>10</sup> in accordance with the following guidelines:

- Revised factors should come from an equivalent or superior source
- Revised factors should be easily audited
- Revised factors should be consistent with the definitions of sustainment or construction
- Revised factors should be consistent with the scope of the Facility Analysis Category
- Revised factors should be suitable for application throughout DoD
